Securing Critical Infrastructure

Its safety depends on phishing-resistant MFA

Across the globe there is an increasing number of malicious actors trying to cause mass disruption to public life and safety by targeting critical infrastructure with cyberattacks. Such attacks were responsible for impacting Ukraine's power grid, striking a Brazil-based meat processing company, holding a Los Angeles hospital's medical records for ransom, and infiltration of email and fare-collecting systems for San Francisco public transit.

Vital sectors and their impact

Although definitions of critical infrastructure vary across countries, these sectors are vital because their incapacitation or destruction would have a debilitating effect on a nation's security, economic security, public health, and/or safety which can pose a physical threat to human lives.

This includes, but is not limited to the following sectors—

Chemical

Banking and Financial Services

Food and Agriculture

Information Technology

Healthcare and Public Health

Government Facilities

National, federal, state, local, tribunal

Commercial Facilities

Communications

Emergency Services

Dams

Critical water retention and control services

Critical Manufacturing

Primary metals, machinery, electrical equipment, transportation

Defense Industrial Base

Companies and subtractors supply materials, services, and facilities to national militaries

Energy

Nuclear Reactors, Materials, and Waste

Transportation Systems

Water and Waste Systems

In an interconnected world, everyone is responsible for strengthening the cybersecurity ecosystem

"One of the greatest cybersecurity threats is the human factor, through phishing attacks when cybercriminals obtain passwords or credentials."

Oleksandr Tarasov

Head of Security Controls at Security Operation Center, Naftogaz-Bezreka (Ukraine's national oil and gas company)

The undeniable proof that the cyber threats targeting critical infrastructure are all too real

40% Cyberattacks targeting critical infrastructure around the world—a 20% increase since June 2020

80% Critical infrastructure organizations that don't adopt zero-trust strategies

89% Electricity, oil & gas, and manufacturing firms experienced cyberattacks that impacted production and energy supply

22% Increase in DDoS attacks on financial firms globally compared to the previous year

$9.3 Average cost for a healthcare data breach—the highest average of any sector

Phishing-resistant MFA's role in securing critical infrastructure

A core part of a successful cybersecurity strategy depends on multi-factor authentication (MFA), but not all forms of MFA are created equal. Modern phishing-resistant authentication and hardware-backed security are the best way to safeguard the most critical information, processes, and IT and OT systems that our society depends on. Which is why, it has become the standard for government agencies and a growing number of regulatory bodies.

See real stories of how these sectors across the globe are implementing modern phishing-resistant MFA within their organizations and supply chain
